It covers many basic and advanced techniques for the identification of anomalous or frequently recurring patterns in a graph, the discovery of groups or clusters of nodes that share common patterns of attributes and relationships, the extraction of patterns that distinguish one category of graphs from

another, and the use of those patterns to predict the category of new graphs.

86 Practical Graph Mining with R ness is more connected compared to a graph with lower connectedness, thus the graph can, in general, resist more link failures. When the value of connectedness is 1, then the graph given is fully connected and so results in a TRUE output for the function is.connected. Link
